

Teamder 1.1.15 — Android Follow-up

vc246 is live on Google Play production at 100%. vc244 was never touched; the higher versionCode superseded it through the normal release flow. iOS was not touched at all.

One thing changed the plan mid-round: vc245 was built and smoke-tested, and the smoke test found that the sign-in loop had **two** broken paths, not one. The second only appears when you actually run the binary. vc246 is the build that fixes both.

1. Every report

The sign-in loop — the one that blocked the release

Reported: a guest starts creating a club or a game, meets the auth wall, signs in, is returned to the create screen, presses create — and the wall opens again. For ever.

Two independent causes, one symptom.

Cause A — Google / Apple. `upgradeAnonymous` links or switches the Firebase session directly and returns an outcome. It never touched `useUserStore`, so after a successful upgrade the store still held the guest object. Two things read it:

read	held	broke
<code>currentUser.isGuest</code>	<code>true</code>	<code>useIsGuest()</code> stayed true → the satisfied gate re-opened
<code>currentUser.onboardingCompleted</code>	<code>true</code> (set by <code>buildGuestUser</code>)	a brand-new account could not be routed to the profile it owes

Fix: `refreshFromSession()` on the store re-reads the signed-in user from the live session, and `onAuthenticated` calls it the moment the sheet reports success. A null read leaves what we have rather than blanking the tree under a live screen; a throw is logged, not propagated.

Ordering is load-bearing and asserted: the refresh runs **before** the `isNewAccount` early return, and **before** `resumePendingAction`.

Files: `src/store/userStore.ts`, `src/hooks/useAuthenticatedAction.tsx`

Commit: `35f4878` · 7 tests

Cause B — email. Found by running vc245, not by reading. "המשך עם מייל" is

the one provider the sheet hands off: it needs two fields, validation and a reset path, so the sheet calls `onCancel()` and navigates to `EmailAuthScreen`.

That unmounts the sheet, so `onAuthenticated` — the refresh **and** the resume — never runs.

`signInWithEmail` sets `currentUser` itself, so this path had no guest loop.

It had a dead end instead: nobody popped the screen and nobody finished the parked club. The comment there said "RootNavigator swaps the stack; nothing else to do here" — and for a guest it does not swap, because a guest is already inside `MainTabs`.

Observed on vc245: `signInWithEmailAndPassword:onComplete:success` in logcat, and the cleared email form still on screen thirty seconds later.

Fix: after a successful **sign-in** the screen performs the sheet's two steps in the sheet's order — go back, then resume through the registered resumer.

Sign-up is deliberately untouched: a fresh account's document carries

`onboardingCompleted: false`, `RootNavigator` does swap to the profile screen, and the coordinator's boot pass resumes after it saves.

Empty-season close

Reported: a club with no played evenings can reach "close the season and start a new one", and needs a minimum of 2 — with an offer to edit the settings when refused.

Root cause: the rule already existed and was already live. Three server guards: `endSeasonNow` refuses a seal under 2, `updateSeasonTarget` refuses a target under 2 (a target of 1 is the same close reached through a number), and `disableClubSeasons` **discards** an empty season instead of archiving it, so the floor cannot become a trap.

I did not trust the deploy timestamp — it sits 21 seconds *before* the commit that added the guard, which would have said "not deployed". I pulled the deployed bundle out of GCS and read it: the guard is there,

`MIN_SEASON_ROUNDS = 2`. The deploy was made from an uncommitted tree.

You still saw the button because the **client** guard landed 24.09 and 1.1.14 was built 22.09.

What was actually missing is your second sentence. The screen disabled the button and put a sentence beside it — correct about the rule, useless about the next step. The press is now allowed and answered: a dialog names the count, states the minimum, and offers "ערוך את הגדרות העונה", where both remedies live. The destructive confirmation is never reached.

Commit: `32b24de` · 12 tests · **no server rule changed**

Season settings — three Pulse reports, one bug

When "לצרף לעונה הנוכחית" is chosen the months chips do **not** end season 1 — the date chips below do, and the months apply from season 2. The screen said otherwise in three places.

Pulse	Reported	Fix
2M99uVNe	club ends in 24 months, settings show 6	the date box renders the PLAN, not the club. On a live club it now waits for <code>targetChanged</code>
qSBHX8Nl	should show what I chose, not the irrelevant months	the confirmation row becomes "משך עונה 2 והלאה" when season 1 is carried
89QX66Lv	"אחרי כמה זמן" is irrelevant here	the heading becomes "אורך העונות מעונה 2 והלאה"

The chips are **not** hidden, as instructed — they are relevant, to the seasons after this one. Hiding them would have left season 2 on a default nobody chose.

The six smaller ones

Pulse	Screen	Fix
9InA6U9X	CommunityEdit	<code>seasonsCloseFirstSeal</code> → "לסגור ולהתחיל חדשה". One key, no hard-coded twin — two code comments quoted the old text and were updated, including the server's byte-identical copy of <code>seasonActivation</code> , which has a mirror test
diyXR2Gi	CommunitiesCreate	the seasons row is now the same card as the three toggles above it — token for token with <code>GroupWizardForm.toggleCard</code> , whole row pressable, <code>BallSwitch</code> . Nothing else on that screen touched
zWzww2ov	SeasonSummary	assists tile → <code>footsteps-outline</code>
w0C73sjM	SeasonSummary	goals tile → <code>football</code>
FihtZR44	SeasonSummary	<code>seasonSectionNumbers</code> → "המספרים שלך בעונה". It is a <code>CardTitle</code> : <code>textAlign: RTL_LABEL_ALIGN</code> , icon-leading row, four more characters on the same line
26mgCkYH	CommunityDetails	the medal beside "הישגי המועדון" removed; "נתוני מועדון" sits above it with a bare heading

"ניצחונות" was not part of the report and keeps rankIcon , as instructed.

The podium celebration survives on goals and assists through the tint.

Guest community details — found in the data, not reported

getGroup and communityDetailsReload , both permission-denied , first seen on 1.1.15 the morning the rollout began.

CommunityDetails reads canonical /groups/{gid} , which the rules gate on membership. The clubs feed always branched correctly; the club chips on a player card and the club row on a match screen never did, and both are guest-reachable.

The bug is older than the release — 1.1.15 only put far more guests in front of those two screens.

clubRouteFor decides once from the store's own list of the viewer's clubs — the same documents the rule checks. Unknown resolves to the public page: before hydration and for a guest, "not a member" is the honest answer.

No Firestore rule was loosened. The guest is routed to the public screen instead of being given access to the protected document.

And the half that would have made it a dead button: PlayerCard is registered in all four stacks, the club pages in three — not ChatStack. navigate() on an unregistered name does nothing and reports nothing. Both are registered there now, and the test asserts the invariant rather than the instance.

2. Auth loop — verification on the release binary

Run on the vc246 universal APK, the exact path you reported.

step	vc245 (before the email fix)	vc246
Guest → Create Club → wall	wall appears, correct copy + "מה שמילאת נשמר"	same
→ המשך עם מייל → sign in	onComplete:success , screen stays on the cleared form	screen leaves, back to the wizard
→ press create again	—	ordinary validation error, NO auth wall

That last cell is the whole test. The second submit went down the signed-in path (createFromValues) and complained about a missing field, rather than

re-opening the sheet. `useIsGuest()` is false.

check	result
Existing account, Create Club	PASS — no second wall
Create Game	same <code>useAuthenticatedAction</code> hook and the same <code>EmailAuthScreen</code> ; covered by the shared fix and its tests, not separately exercised on device
New account → profile completion	not exercised on device — would create a production account
PendingAction resume	wired and unit-tested; the on-device resume produced no duplicate club
Duplicate creation / lost draft / stale guest / infinite loop	none observed

3. CommunityDetails

entry	result
public/community feed	already correct, unchanged, asserted by test
PlayerCard chip	routed by membership
round/game row	routed by membership
ChatStack → PlayerCard → community	destination registered; was a silent no-op
member / admin	unchanged — they still get the canonical document

Verified by the test matrix across all four stacks. **Not re-exercised on device

this round**; the earlier guest-roster run on 1.1.15 showed zero

`permission-denied`.

4. Seasons

rounds	behaviour
0	close refused; dialog offers the settings; switching seasons off discards the empty season
1	same, with "שחקו עוד מחזור אחד"
2	close allowed
>2	close allowed

Server-enforced and unit-tested at each boundary; the 0 and 1 copy differ

deliberately, because "play one more" is wrong advice for zero.

5. Tests

gate	result
app tsc --noEmit	clean
functions tsc --noEmit	clean
Jest	165 suites / 2490 tests, all passing (baseline was 165 / 2486)
Firestore rules	277 tests, 274 pass, the same 3 pre-existing failures

No regression from the stated baseline. Rules **not deployed**.

6. Git

Final HEAD	085aa23724a03fbfa0a0fde01967909b0accf86c
Status	clean

Commits in the build, oldest first:

```
32b24de A season too short to end now says what to do instead
06d1cae A guest tapping a club no longer lands on the members' page
35f4878 fix: signing in from the auth sheet now tells the app it happened
26d8dc9 Nine reports from the seasons screens, and what each of them said
085aa23 fix: the email provider finishes what the auth wall parked
```

No already-reviewed commit was squashed or rewritten.

7. Android

versionCode	246
EAS build ID	59b57e00-7346-4325-9a9f-4a7ffb199b46
Build commit	085aa23724a03fbfa0a0fde01967909b0accf86c — matches HEAD exactly
Bundle sha1	99a91b7696c722ef93fe573652ff4870309bc217
Play status	uploaded, validated, committed
Rollout	completed — 100%

Production track now reads 1.1.15 · ['246'] · completed . vc244 was not stopped, rolled back or edited; vc246 superseded it by being a higher versionCode.

⚠️ **vc245 exists on EAS and was never uploaded to Play.** It was built from

26d8dc9 , before the email fix, and the smoke test is why it was not shipped.

8. iOS — NO ACTION TAKEN

Confirmed by reading App Store Connect and changing nothing:

```
App Store version 1.1.15 – WAITING_FOR_REVIEW
build 108 – VALID
```

No withdraw, no cancel, no build 109, no new version, no state change.

Not in build 108: all five commits above. The sign-in loop — both halves — is live on iOS if Apple approves build 108, and the email half affects iOS identically.

9. Production

- **Firestore Rules: NOT DEPLOYED.** `firestore.rules` untouched. The only `functions/` change this round is one comment in `seasonActivation.ts`, required by the byte-identical mirror test. Nothing was deployed.
 - No Functions, Hosting, Storage, indexes, Remote Config, App Check or Auth configuration deploys.
 - No Expo/RN upgrade, no UIScene, no Crashlytics, no unrelated error fixes, no visual refactor.
-

What I could not verify on device

Said plainly rather than implied:

- **Create Game** was not separately exercised; it shares the hook and the screen that were fixed and tested.
- **New-account profile routing** was not exercised — it would create a real account in production.
- **Google Sign-In** — no Google account on the emulator.
- The nine Pulse fixes have **no on-device proof shots**. Emulator text entry and `uiautomator` were both unreliable for hours; every UI claim in this round is backed by a screenshot instead, and the nine are covered by source-level tests. They are committed and shipped but **not yet written back to Pulse**,

because my own rule is that a note without a proof shot is not finished.
