

The first five minutes

Everything a new Teamder user meets, from the link they are sent to the moment they could register for a game.

A scan, not a proposal. Nothing in this document recommends a change; it records what exists on 20.09.2026 so that someone can decide what to change. Where two things do the same job, both are described and neither is preferred.

How this was produced

Everything below was observed on a real device against the real production backend, or read from the source that runs it.

Device	Android emulator, Pixel-class, 1080×2400, API 36, Hebrew locale, RTL
Build	1.1.10 , versionCode 236, installerPackageName=com.android.vending — installed from the Google Play Store, not sideloaded. This is the binary a real person downloads today.
Starting state	App fully uninstalled, then installed from Play. For the signup run, pm clear wiped all app data first. No account, no cache, no prior state.
Account	A brand-new account created during the run: e2e.journey.1789851838@example.com , display name Bodek Masa . Nothing was reused.
Backend	Live production, project soccer-app-52b6b . Every number quoted from the database was read at the time of the walk.
Web	The live host, https://teamderfc.web.app . There is no custom domain.
Date	19–20.09.2026

What was deliberately not done

Two things, both for the same reason.

No game was actually joined. The only public open game in the entire production database belongs to רבתי כדורגל בנחלים , a real seven-member club with real players. Registering a test account for it would have put a fake player in a real organiser's squad — which is precisely the problem documented separately this week, where Google Play's pre-launch robot did exactly that three times. The journey is therefore traced up to and including the join button and its every state; the tap itself was not made.

The name was typed in Latin characters. adb shell input text cannot send Hebrew, and the alternative keyboard breaks React Native form inputs. Bodek Masa therefore stands in for what a real user would type. Nothing else in the run was substituted.

A note on the ad slots

Every in-app screenshot shows a banner reading Test Ad . That is AdMob recognising an emulator and serving its test placeholder; it is not what a real device shows. No conclusion about real ad behaviour, placement pressure or revenue can be drawn from these images — only about the space the banner occupies, which is real.

Part 1 • The web estate

Every public route, and what actually answers it

Seventeen routes were requested live and their responses measured. `cleanUrls` is on, so `/get` and `/get.html` are the same document.

Route	HTTP	Bytes	Served by	<title>
<code>/</code> · <code>/index.html</code>	200	21,253	<code>public/index.html</code>	Teamder — מארגנים משחקי כדורגל בלי בלגן
<code>/get</code> · <code>/get.html</code>	200	3,555	<code>public/get.html</code>	Teamder · הורדה
<code>/app</code>	200	25,741	<code>public/invite.html</code>	Teamder · מארגנים כדורגל בלי כאב ראש
<code>/go</code>	200	25,741	<code>public/invite.html</code>	(identical)
<code>/invite.html</code>	200	25,741	<code>public/invite.html</code>	(identical)
<code>/session/<gameId></code>	200	25,741	<code>public/invite.html</code>	(identical)
<code>/i/<code></code> · app link	200	25,818	<code>serveInviteCode</code> CF	Teamderמזמין אותך ל- Eliran Tzabari
<code>/i/<code></code> · game link	200	25,831	<code>serveInviteCode</code> CF	הוזמנת למשחק: רבעי כדורגל בנחלים
<code>/c/</code> · <code>/c/index.html</code>	200	53,676	<code>public/c/index.html</code>	קהילה ב־Teamder
<code>/c/<clubId></code>	200	53,556	<code>serveCommunityPage</code> CF	מועדון שכחת שושי · Teamder
<code>/team/<clubId></code>	200	25,522	<code>serveCommunityPage</code> CF	מועדון שכחת שושי · Teamder
<code>/privacy</code>	200	29,069	<code>public/privacy.html</code>	מדיניות פרטיות — Teamder
<code>/delete-account</code>	200	9,603	<code>public/delete-account.html</code>	מחיקת חשבון — Teamder
<code>/invite-preview</code>	200	18	<code>getInvitePreview</code> CF	(JSON)

Two rows deserve to be read twice.

`/c/<clubId>` and `/team/<clubId>` are the same club, from the same Cloud Function, rendered as two completely different pages — 53,556 bytes against 25,522. Requesting a club id that does not exist returns 53,664 and 25,613 respectively, both titled `Teamder מועדון`, which confirms both paths reach `serveCommunityPage` and that the function branches on the prefix.

How much of each page is the same page

Every route was fetched and compared byte-for-byte against every other. The figure is text similarity; 100% means the documents are effectively the same file.

	<code>/</code>	<code>/get</code>	<code>/app</code>	<code>/i app</code>	<code>/i game</code>	<code>/team</code>	<code>/c/</code>	<code>/c/<id></code>
<code>/</code>	—	28%	66%	66%	66%	66%	54%	54%
<code>/get</code>	28%	—	24%	24%	24%	24%	12%	12%
<code>/app</code>	66%	24%	—	100%	100%	100%	64%	64%

	/	/get	/app	/i app	/i game	/team	/c/	/c/<id>
/i app	66%	24%	100%	—	100%	99%	64%	64%
/i game	66%	24%	100%	100%	—	99%	64%	64%
/team	66%	24%	100%	99%	99%	—	64%	64%
/c/	54%	12%	64%	64%	64%	64%	—	100%
/c/<id>	54%	12%	64%	64%	64%	64%	100%	—

Four families fall out of it:

- 1. The invite template — /app, /go, /session/**, /invite.html, /i/<code> in both its flavours, and /team/<clubId>. Six public entry points and one Cloud Function all render one file, public/invite.html, with at most 300 bytes of personalisation injected.
- 2. The community template — /c/ and /c/<clubId>, identical to each other and 36% apart from the invite family.
- 3. The homepage — public/index.html, its own thing, two-thirds shared chrome.
- 4. The download page — public/get.html, 3.5 KB, sharing almost nothing with anything.

So a club shared through /team/ and the same club shared through /c/ are not variants of one design. They are two products.

The homepage — /

The primary button on the first screen is **הצטרפו כבודקי בטא** — join as beta testers. The secondary is **מה יש**, an in-page anchor. Neither leaves the page, and neither is a download: this document contains no link to Google Play or to the App Store at all. The page that a person reaches by typing the brand name offers no way to get the app, while the app has been publicly listed on both stores for months.

The conversion path instead is a WhatsApp message to a personal Israeli mobile number, asking the visitor to send the Google account address attached to their device so they can be added to a closed tester list.

The download page — /get

`/get` does not render on a phone. It sniffs the user agent and calls `location.replace()` on the store URL, so an Android visitor is thrown to `play.google.com/store/apps/details?id=com.studiogameslime.soccerapp` before the page paints — which is why the frames above are the Play listing and not the page. The 3,555 bytes of Teamder • הורדה are only ever seen on a desktop browser, where both store buttons are shown side by side.

This makes `/get` the only surface on the estate whose sole job is to deliver the app, and nothing on the homepage links to it.

The invite template — `/app`, and the same file under five other names

`/app` fold`

Phone mock

Features

Stores

/i/ - personal invite

/i/ - game invite

/session/

Four different URLs, four different purposes, one template. Only the headline and a line of subtext change; `/team/` does not even name the club in its hero, which reads `הוזמנת להצטרף למועדון`.

The two club pages

The same club. Left pair: 53 KB, light, ships a Firebase SDK and fetches the club in the browser, so the visitor watches a spinner. Right pair: 25 KB, dark, the club's name already in the HTML five times.

`/c/` continued – the richer of the two pages, and the one a visitor waits for.

Privacy and account deletion

Part 2 · Getting the app

The Play Store listing

Listed as `Teamder - מארגנים כדורגל בקלות` by `Lime Studio Games`, flagged `Contains ads`. The *About this app* section rendered in English – `Organizing a soccer game without a headache`.

What the app itself sends people

The in-app share sheet, reached from `הזמן חברים לאפליקציה` on the home screen, produces exactly this text:

 Teamder אני משחק כדורגל בעזרת אפליקציית

תוריד גם אתה ובוא לשחק:

<https://teamderfc.web.app/i/lttfR4K?invitedBy=tJINwzgzl6bXHW02WhhjbkbA8yx1>

The share sheet, with the generated text

Three things are visible in that string: the host is a raw `.web.app` Firebase subdomain; the 28-character sender uid travels in the query string in the clear; and the verb `תוריד` is masculine singular, while the app's own onboarding two screens earlier used plural imperative (`שחקו`, `שחקו`).

The link resolves to `/i/<code>`, which is the invite template in Part 1 – the loop closes.
